

Waste is a monstrous worldwide problem and by disregarding it is getting bigger and bigger every day and our attitude towards waste will completely affect our future. In order to save our planet and ourselves we have to do something and find a solution for this problem.

It is impossible to find a solution, which will cover 100% of this problem, however, in spite of this fact I am bringing up my suggestions to help solving this problem further and to reduce consequences in the future.

### **Paper covers and packaging**

Of course, this solution has both its advantages and disadvantages. As regards the disadvantages, for example, we will cut down more trees in order to manage cover and packaging production, however, as long as I am concerned, planting more trees should not be a major problem for us – people.

### **Own bottles and bags**

This solution is already in process, nevertheless, not a lot of people follow it, therefore we should educate people more about this solution since we could possibly gain major independence from plastic bags and bottles etc. For example, an employee in a shop will ‘pour’ you a drink of your choice into your own bottle that you bring there.

Hopefully, you stop for a moment and you think about all possible things you can do to solve this problem and, by extension, you involve yourself in solving this problem.
